Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is human E93 programmed cell death modulating protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disporders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for apoptosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Claim 1; Fig 4; 88pp; English

                                                                                                                                                       CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC and gene mapping, and in recombinant production of (II). The polymerase chain reaction (PCR) primers, oligomers, and for chromosome CC polymucleotides are also used in diagnostics as expressed sequence tags (T) crestore normal activity of [I]) or to treat disease states involving CC (II). (II) is useful for generating antibodies against it, detecting or creating a polypeptide in tissue, as molecular weight markers and as food supplement. (II) and its binding partners are useful in medical CC imaging of sites expressing (II). (I) and (II) are useful for treating CC disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in CC diagnostics, forensics, gene mapping, identification of mutations CC and to produce other types of data and products dependent on DNA and CI and to produce other types of data and products dependent on DNA and CI amino acid sequences. ABG00010-ABG30377 represent novel human CC diagnostic amino acid sequences of the invention.

CC specification, but was obtained in electronic format directly from WIPO CC at fig. wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Consignated ORF (open reading frame) 1-4534, and sequences ABN75054-CC ABN75957 represent cDNAs encoding them. The invention also encompasses CC polypeptides at least 80% identical to the ORF1-ORF4534 (collectively CF referred to as ORFX) proteins, polymucleotides at least 85% identical to the ORF1-ORF4534 (collectively CF referred to as ORFX) proteins, polymucleotides at least 85% identical to the ORF1-ORF4534 (collectively CF referred to as ORFX) proteins, polymucleotides at least 85% identical to the ORF1-ORF4534 (collectively CF referred to as ORFX) proteins, polymucleotides and collectively proteins, methods of screening for modulators of ORFX proteins, antibodies specific for ORFX proteins, methods of detecting ORFX proteins, antibodies of creivity, and methods of screening individuals for a predisposition to an ORFX proteins of the invention have a wide crange of biological activities, such as cytokine, cell proliferation, cell differentiation, immune modulation, haematopolesis regulation, this collective collectivity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, completely characteristics, fertility and behaviour. ORFX proteins, collective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, collective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, collective activity, and may also be involved in the determination of bodily characteristics, fertility and behaviour. ORFX proteins, collective activity, and characters of tissue growth and regeneration, consumers, collective activity, and characters of tissue growth and regeneration, collective activity and behaviour. ORFX proteins, and cholesterol ester collective activity and behaviour and collectivity.

Collective activity and behaviour and collectivity of orf or collectivity and behaviour and characterial, sequences and infectious diseases cau
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for
                                                                                                                                                                                                                                                                                                                         04-OCT-2002

The present invention relates to novel programmed cell death modulating CC proteins and polynucleotides encoding such proteins. Sequences of the convention are useful to screen potential cellular apoptosis inhibiting CC compounds to determine their use as therapeutic agents for treatment of CC diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in CC treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, myeloma. Inhibition of the activity of the sequences of the CC invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis C pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic CC injuries (e.g., myocardial infarction, stroke, reperfusion injury), cf the stroke and other infectious or genetic immunodeficiencies. Sequences of the contraction are used as vaccinae and in none theoretics on Sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                 treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma. Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is mouse E93 programmed cell death modulating protein conserved
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The sequence data for this patent did not form specification, but was obtained in electronic !
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invent

                                                                                                                                                                                                                                                                                                    useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, melanoma, myeloma. Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic anaemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of diseases associated with increased programmed cell death. They are also
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           aplastic anaemia; ischaemic injury; myocardial infarction; stroke; reperfusion injury; toxin-induced disease; genetic immunodeficiency; vaccine; gene therapy; lymphoma; cytostatic; melanoma; neuroprotective; myeloma; nootropic; vasotropic; immunostimulant; cerebroprotective;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Fruit fly; programmed cell death modulating protein; adenocarcinoma; cellular apoptosis; leukaemia; acquired immunodeficiency syndrome; AIDS neurodegenerative disease; Alzheimer's disease; retinitis pigmentosa; Parkinson's disease; myelodysplastic syndrome; cerebellar degeneration;
                                                                                                                                                                                                                                  Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to novel programmed cell death modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 9; Page 65-71; 88pp;

Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial or C

Claim 1; Fig 1; 88pp; English

proteins and polynucleotides encoding such proteins. Sequences of the invention are useful to screen potential cellular apoptosis inhibiting compounds to determine their use as therapeutic agents for treatment of The present invention relates to novel programmed programmed cell death modulating

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocaroinoma, leukaemia, lymphoma, melanoma, myeloma. Inhibition of the activity of the sequences of the invention are useful for treating disorders associated with increase in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzheimer's disease, retinitis pigmentosa, Parkinson's disease and cerebellar degeneration), ischaemic injuries (e.g., myocardial infarction, stroke, reperfusion injury), myelodysplastic syndromes (e.g., aplastic on anemia), toxin-induced diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present sequence is fruit fly E93 programmed cell death modulating protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cellular apoptosis; leukaemia; acquired immunodeficiency syndrome; AIDS; neurodegenerative disease; Alzheimer's disease; retinitis pigmentosa; Parkinson's disease; myelodysplastic syndrome; cerebellar degeneration; aplastic anaemia; ischaemic injury; myocardial infarction; stroke; reperfusion injury; toxin-induced disease; genetic immunodeficiency; vaccine; gene therapy; lymphoma; cytostatic; melanoma; neuroprotective; myeloma; noottopic; vasotropic; immunostimulant; cerebroprotective;
proteins and polynucleotides encoding such proteins. Sequencinvention are useful to screen potential cellular apoptosis compounds to determine their use as therapeutic agents for t
                                                                                                                                                 Novel programmed cell death modulating proteins, useful for treating preventing disorders associated with abnormal cell proliferation and apoptosis such as cancer, stroke, Parkinson's disease, myocardial
                                     The present invention relates to novel programmed cell death modulating proteins and polynucleotides encoding such proteins. Sequences of the
                                                                                                                                                                                                                                                                                                                                                27-OCT-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                           02-MAY-2002

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      CC diseases associated with increased programmed cell death. They are also CC useful for treating or preventing disorders associated with decrease in apoptosis. Programmed cell death modulating sequences are useful for treating or preventing cancer e.g. adenocarcinoma, leukaemia, lymphoma, CC melanoma, myeloma. Inhibition of the activity of the sequences of the cinvention are useful for treating disorders associated with increase CC in cell death or apoptosis such as acquired immunodeficiency syndrome (AIDS), neurodegenerative diseases (e.g., Alzhamer's disease, retinitis CC pigmenntosa, Parkinson's disease set (e.g., Alzhamer's disease, retinitis CC injuries (e.g., myocardial infarction, stroke, reperfusion injury), CC myelodysplastic syndromes (e.g., aplastic annemia), toxin-induced CC diseases and other infectious or genetic immunodeficiencies. Sequences of the invention are used as vaccines and in gene therapy. The present conserved demain

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      0
```

The invention relates to a nucleic acid molecule encoding a bot neurotoxin light chain (BoNT LC) serotype A, where the DNA has that is expressible in a host organism other than Clostridium,

botulinum

sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          total A+T content that is less than about 70% The BONT LC protein is useful in vaccination against botulism, for eliciting protective immunity in a mammal, for treating dystonias, spasticity, pain, ocular motility, facial dyskinesias, stiff-person syndrome; bladder dysfunction, segmental myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles, conditions characterised by hyperactivity of the lower motor neuron, and to control autonomic nerve function or tiptoe-walking due to stiff muscles common in children with cerebral palsy. The sequences are also useful for screening for botulinum neurotoxin inhibitors. This sequence represents a botulinum neurotoxin light chain serotype A protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A 372 kDa human kinetochore protein, CENP-F (AAR99795), is detected by immunofluorescence microscopy only during the G2 and M phases of a cell cycle. It is the product of a cDNA clone (AAT34578) isolated from a breast carcinoma cDNA library. Recombinant CENP-F can be produced by expression in prokaryotic or eukaryotic host cells. CENP-F can be used to detect autoimmune antibodies to the protein, which may provide an early diagnosis for the onset of various malignant diseases. Use of CENP-F as a cell cycle marker allows the specific detection of G2 and M phase cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA encoding kinetochore protein - used as a marker for the G2 and phases of a cell cycle, partic. for detection of malignant diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           8
                                                                                             The invention describes a method of screening a candidate antifungal compound for interaction with essential proteins (EP) or for modulation of EP activity e.g fungal gene transcription. The proteins tested in the CC invention include RPC14, PDB3, TFR2, NAB2, MPT1, MTR2, BOS1, PDL30, RSA2, CC SQT1, MTW1, TFB1, SPC98, BFR2, RNA1, GCD7, SX16, NIP1, LCP5, NCE101, CC ECO1, ORC2, CNS1, YPD1, TYM10 and SRB4 from S. cerevisiae, C. albicans CC and human homologues. The method involves contacting a culture with one CC or wrote test compounds and determining the effects on the growth or CC viability of the culture of cells which preferably comprises fungal cells or yeast cells. Preferably the identified compounds interact with, or CC modulate (preferably inhibit) activity of C. albicans EP. The inhibitor CC inhibiting fungal, particularly C. albicans erowenting or compounds identified by the method are useful for preventing or in a CC mammal. The antifungal agents interact with essential fungal elements can be used to treat fungal infection by preventing the growth and preferentially killing the fungi, but does not inhibit the biological activity of mammalian homologues. This amino acid sequence represents a compound of the compounds of the preventing the distribution of the preventing of the preventing the distribution of the preventing the distribution of mammalian homologues. This amino acid sequence represents a compound of the preventing the distribution of the preventing of the preventing the distribution of the preventing the province of the preventing the distribution of the preventing the preventing 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     protein, effects

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072).

The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of NAAP, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, cirrhosis, hepatitis or cancer); developmental disorders (e.g. renal tubular acidosis, anaemia or mental retardation); neurological disorders (e.g. Alzheimer's disease, Parkinson's disease or epilepsy); and aucoimmune/inflammatory disorders (e.g. AIDS, allergies, asthma or Crohn's disease). The DNA sequences of the invention are useful for creating transgenic animals to model human disease. The present amino acid sequence represents a human nucleic acid-

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
